CAMPAIGN PERFORMANCE LAB

LingoLoop: optimization brief

Synthetic case study. Aug 22 - Sep 20, 2026. All amounts USD.

$16,823 spend | 5,193 tap-through installs | $3.24 CPA

The account average hides inefficient search traffic.

The overall CPA is below the fictional $7.00 target, but campaign and search-term detail reveal very different costs. Investigate relevance before recommending more budget.

Campaign	Spend	Tap installs	Tap CPA
Brand	$5,542	3,805	$1.46
Category	$4,554	864	$5.27
Competitor	$4,575	312	$14.66
Discovery	$2,152	212	$10.15

1. Investigate an irrelevant discovery term

'free spanish translation' spent $1,071 across 855 taps and produced 10 installs. Review search intent and consider a negative keyword if the app cannot satisfy it.

2. Propose a bounded allocation test

Explore a 15% Competitor-to-Category spend transfer with a 20% marginal Category CPA increase. Keep total spend constant. Demand, auction response, and user quality remain unmodeled.

3. Define the evaluation before the change

Use mature tap-through CPA, conversion, and new-download mix. Validate post-install quality and agree a budget cap and stop condition. Modeled results are not measured lift.
